

YOUR SMILE MAKEOVER

From crowns and veneers to implants and teeth whitening, prosthodontists use the most advanced technology and materials in dentistry to restore and improve the natural beauty and strength of your teeth.

Don't settle for stained, chipped, worn, or missing teeth. Your appearance and your health will benefit from visiting a prosthodontist.

Nobody smiles like you do. That's why your prosthodontist will start by talking to you about your goals and then develop a plan to find your ideal smile.

Prosthodontists are dentists who have completed three additional years of postgraduate training beyond dental school. In addition to helping patients with esthetics, they use the latest techniques, including advanced digital technology, to create personalized treatment plans and deliver efficient, long-lasting dental care.

Prosthodontists specialize in restoring beautiful smiles with dentures, dental implants, cosmetic dentistry, crowns, bridges, and more. They are dedicated to improving the oral health of their patients, from appearance to function.

Everything starts with a smile. Doesn't your smile deserve the best care possible?

Do you feel self-conscious about your smile?
Do you cover your mouth when you speak?
A prosthodontist can help.

Restore Teeth with Natural-Looking Crowns

Do you have a tooth that looks worn or damaged, or an old filling with recurrent decay? Your tooth can be strengthened, protected, and beautified with a crown.

Crowns, also known as caps, are made from a variety of dental materials. Prosthodontists use materials that are durable and can be made to match the appearance of your natural teeth. Using advanced digital technology, your prosthodontist can determine the correct type of crown for your smile.

Replace Unsightly Fillings with Inlays

Unsightly or broken-down fillings can be replaced with all-ceramic inlays. These are made from a tooth-colored material that is precisely sculpted to match the shape of your tooth. The bonding process may even help strengthen the tooth.

Replace Missing Teeth with Implants and Bridges

Prosthodontists can offer several options to replace missing teeth. These new teeth can be designed to blend perfectly with your natural teeth. Not only will your new teeth look great, they'll provide excellent support for when you speak or chew.

Using innovative digital technology, a prosthodontist can analyze the color and shade of your existing teeth, design new teeth to match, and recommend the best way to achieve the smile you're looking for.

Brighten Your Smile with Teeth Whitening

Tooth whitening lightens discolored enamel and dentin. Studies have shown that proper use of dentist-monitored whitening systems can enhance your smile without harming your oral health.

After a thorough examination and diagnosis, your prosthodontist can determine if you are a good candidate for in-office or at-home whitening.

Create a Beautiful Smile with Veneers

If you are not pleased with the alignment, color or shape of your teeth, consider ceramic veneers. After careful planning and a slight modification of the tooth enamel, the prosthodontist will bond a thin layer of porcelain to the front of your teeth.

Popular among models and celebrities, veneers can be used to correct minor flaws in individual teeth. They are often used on multiple adjacent teeth to create a uniform and attractive smile.
